## Greedy Algorithms: A Step-by-Step Approach

Greedy Algorithms prioritize immediate gains, making locally optimal choices at each step. This approach, while not always guaranteeing a globally optimal solution, often yields satisfactory results in practical scenarios. 'Algorithms Illuminated' illuminates the intricacies of Greedy Algorithms through well-structured explanations and engaging examples:

- **Coin-Changing Problem:** Determine the minimum number of coins required to make change for a given amount, using coins of various denominations.
- **Activity Selection Problem:** Select the maximum number of non-overlapping activities from a set, given their start and end times.
- **Huffman Coding:** Construct an optimal prefix code for a set of symbols, minimizing the average code length.

## Dynamic Programming: A Divide-and-Conquer Approach

Dynamic Programming tackles complex problems by breaking them down into smaller subproblems and storing the solutions for future reference. This divide-and-conquer strategy leads to highly efficient algorithms with exponential time complexity reductions:

- **Fibonacci Sequence:** Calculate the nth Fibonacci number efficiently, avoiding redundant calculations through memoization.
- **Shortest Path Problem:** Find the shortest path between two nodes in a weighted graph, using the Bellman-Ford algorithm.
- **Knapsack Problem:** Determine the maximum value of items that can be packed into a knapsack with limited capacity.

## Beyond Theory: Practical Applications

'Algorithms Illuminated' not only provides a thorough theoretical foundation but also demonstrates the practical significance of Greedy Algorithms and Dynamic Programming in various domains:

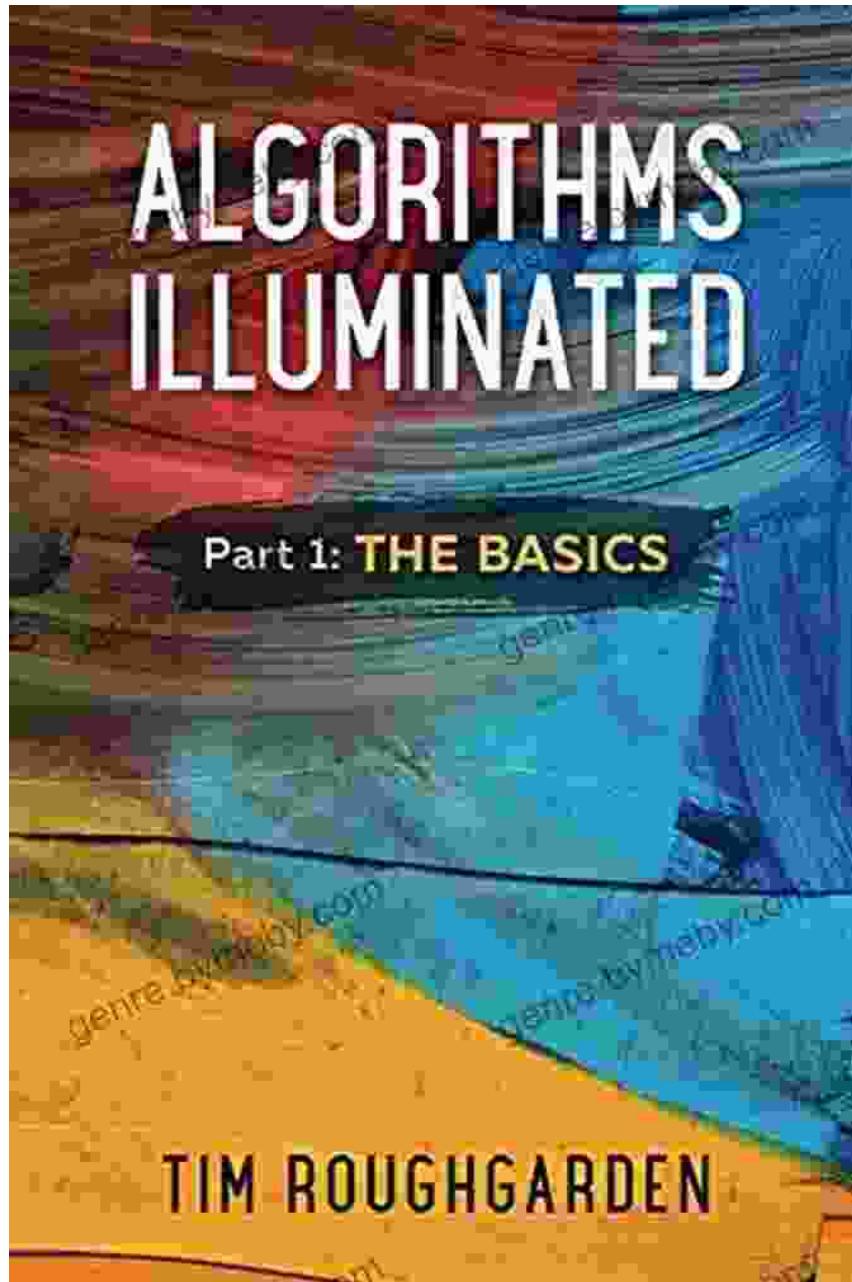

- **Network Optimization:** Routing traffic efficiently through a network to minimize delays.
- **Data Compression:** Utilizing Huffman Coding to reduce the size of files without significant loss of information.
- **Scheduling Problems:** Optimizing the scheduling of tasks to maximize productivity.
